Do you know what unknown threats could be running in your network?

Due to the alarming rate of security incidents, network security has never been more top of mind for senior executives. This is due to most security solutions are blind to what is actually running on the network. Do you know if your organisation has the ability to rapidly respond to sophisticated cyber threats? Key questions to ask are:

- How effective is your current network security solution?
- Are you struggling with the sudden influx of devices?
- How are applications and web resources used within your network?
- Do you have a comprehensive understanding on potential vulnerabilities that could be exposing your organisation?

Fortinet is here to help with our Cyber Threat Assessment report to validate your network’s security accuracy, application usage and performance in three key ways.

Security and Threat Prevention
Find out which vulnerabilities are affecting your network and the risks to exposure including “at risk devices”

User Productivity
Discover which applications and web resources users are accessing and how they are being utilised within your network

Network Utilisation and Performance
Understand how your network security can be optimised for maximum performance

How it works:
A Fortinet expert will deploy a FortiGate next generation firewall to monitor key indicators within your network, 5-7 days later will present you with a comprehensive report to gage your company’s security posture and provide recommendations.
